

## IN THE SPECIFICATION

Please replace paragraph [0055] at pages 26-27, with the following rewritten paragraph:

[0055]

It has been described that the playback timing of the video stream data included in the AV stream is different from that of the audio stream referred to by the Sub Path. To put it more specifically, this means that the playback timing of the video stream included in the AV stream is synchronous with that of the ~~video~~ audio stream (i.e., the audio stream is associated with the video stream), but a specific association, i.e., while a predetermined frame in the video stream is being played back, the corresponding sound is played back, is not given. More specifically, in the example shown in Fig. 7, the playback timing of the video stream is synchronous with that of the audio stream, and also, a specific association, i.e., while a predetermined frame in the video stream is being played back, the corresponding sound is played back, is given. In contrast, in the example shown in Fig. 8, although the playback timing of the video stream is synchronous with that of the audio stream, a specific association is not given, which means that, while a predetermined frame in the video stream is being played back, the corresponding sound is not played back.
